Assignment 4

March 15, 2015

1. Load the **movies** dataset in **ggplot2** package
 - (a) Look at the help page of **movies** dataset and convert variables to their correct data type
 - (b) Create a categorical variable named **Review** with the following categories:
 - ***Awesome*** where *rating* greater than 8.5
 - ***Good*** where *rating* between 7.5 and 8.5(included)
 - ***Average*** where *rating* between 5 and 7.5(included)
 - ***Bad*** where *rating* less than 5
 - (c) What are the top 10 and bottom 10 rated movies
 - (d) Select the best rated movie in each decade
 - (e) What is the average length of a movie? Check if there is an increasing trend in the average length and average rating of movies over decades
 - (f) What is the count of action, comedy, drama, documentary, animation movies released on or after 2000
 - (g) Select the movies which contain the word **seven**. Note that the result should not depend whether letters are in lower or upper case
 - (h) What is the average number of **votes** of **Awsome** movies
 - (i) Give the count of missing values for each variable
 - (j) How many unique movie titles are there? Name the most common movie title and give its count
